**Abstract:** We are now noticing a certain fog about the way to be in the world, there are of course multiple turbulences of behavior, even violent aggression, as is happening not far from us, trends and options are emerging and they are not exactly congruent with what we like to hope for. That is why it is sincerely believed that an excess of lucidity, reason, calculation is needed, in the manner of the elders that have before expressed their economic wisdom, in order to draw our profile as a society and as individuals who do not become victims of the disorder that is foreshadowing in the world, do not get under the times again.

And above all, it is necessary to stop deceiving ourselves, to stop misleading ourselves, to prefer postponing the best thought and the most effective action, leaving things to go only slowly.

We know very well that in order for one economic action to perform, it needs to be based on economic thinking applied to real problems, and these problems must be identified, named, understood and solved correctly, without detours, here - of course - and - above all - now.

More precisely, economic thinking has an ultimate urgency to satisfy: to abandon the ideal schemes, all-providing theories and to create ones that make the Romanian economy capable of producing more than the Romanians eat.

Well, there are intense, laudable, even award-winning preoccupations that cover up research time and divert creative energy to study what fits, unfortunately, only elsewhere.

Among others, it is worth mentioning what represents the avalanche of research and studies on sustainable development.

We often ask, and we do so on this occasion: what is the point of spending time to decipher what is implemented the day after tomorrow when today it is absolutely necessary to think about how to do it tomorrow in order to get out of underdevelopment, after all, the day after tomorrow?

Can we apply a sustainable development program when we have not gone beyond the stage of mobilizing energies for a sustainable exit from underdevelopment? Sustainable development emerges as a practical possibility when a country has advanced seriously on the development highway, and above all has traveled through important segments accepted as a comfortable installation in the primary processes of modernity, industrialization, urbanization and emancipation.

Our honorable mission is to design corrections in the structure of Romania's economy, to propose those revealing studies for changes in strategic vision to return to the potential of over 11 million jobs, not just the 5.7 million that we currently have. That is to say, without delay, to reabsorb the economic emigration, unusually high, in all history, for a European country.

This must be the object of our research, through which we provide the conceptual support of the regeneration of subtle energy for development, the fund of entrepreneurial initiative and commitment, and also the predisposition to work in the country.
